The screenshot shows the Oxford Journals website. At the top right, there are links for 'Sign In' and 'Register' (labeled D). The main header features the 'OXFORD ACADEMIC Journals' logo. Below the logo is a navigation bar with four main categories: 'Journals A to Z' (labeled A), 'Journals by Subject' (labeled B), 'Customer Services', and 'Resources'. The 'Journals by Subject' dropdown menu is open, showing categories like 'Arts & Humanities', 'Law', 'Medicine & Health', 'Science & Mathematics', and 'Social Sciences'. To the right of the navigation bar is a search bar with a dropdown menu set to 'All Journals' and a search icon (labeled C). Below the navigation bar, there are several featured sections: 'Part of the academic community' with a background image of a building, 'COVID-19 information hub' with a background image of a microscope, 'Frequently asked questions' with a background image of a pen, and 'Resources on race and diversity' with a background image of books. A yellow callout box labeled 'COVID-19 관련 액세스 안내' points to the COVID-19 hub. Another yellow callout box labeled '자주 묻는 질문&답변 소개' points to the frequently asked questions section. At the bottom, there is a section for 'Resources for...' (labeled E) with a background image of a bookshelf.

Bayesian Models, Delusional Beliefs, and Epistemic Possibilities

Matthew Parrott

Abstract

The Capgras delusion is a condition in which a person believes that an imposter has replaced some close friend or relative. Recent theorists have appealed to Bayesianism to help explain both why a subject with the Capgras delusion adopts this delusional belief and why it persists despite counter-evidence. The Bayesian approach is useful for addressing these questions; however, the main proposal of this essay is that Capgras subjects also have a delusional conception of epistemic possibility, more specifically, they think more things are possible, given what is known, than non-delusional subjects do. I argue that this is a central way in which their thinking departs from ordinary cognition and that it cannot be characterized in Bayesian terms. Thus, in order to fully understand the cognitive processing involved in the Capgras delusion, we must move beyond Bayesianism.

Abstract

I defend a radical interpretation of biological populations—what I call population pluralism—which holds that there are many ways that a particular grouping of individuals can be related such that the grouping satisfies the conditions necessary for those individuals to evolve together. More constraining accounts of biological populations face empirical counter-examples and conceptual difficulties. One of the most intuitive and frequently employed conditions, causal connectivity—itself beset with numerous difficulties—is best construed by considering the relevant causal relations as ‘thick’ causal concepts. I argue that the fine-grained causal relations that could constitute membership in a biological population are manifested by different causal relations. If membership as being a member of a population is a thick concept, the different causal relations showing that position depend on a view of the world defended here.

initative and frequently employed conditions, causal connectivity itself beset with numerous difficulties—is best construed by considering the relevant causal relations as ‘thick’ causal concepts. I argue that the fine-grained causal relations that could constitute membership in a biological population are huge in number and many are manifested by degree, and thus we can construe population membership as being defined by massively multidimensional constructs, the differences between which are largely arbitrary. I end by showing that positions in two recent debates in theoretical biology depend on a view of biological populations at odds with the pluralism defended here.
